IIIT Sri City

Delays in Packet Switched Networks

- Packets travel from source to destination via intermediate routers/switches.
  - Processing delay
  - Queueing delay
  - Transmission delay
  - Propagation delay

- Nodal delay = Processing delay + Queuing delay + Transmission delay + Propagation delay

Processing Delay

- Time required to examine the packets header
  - Determines where to direct the packet
  - Check for errors
- Order of microseconds

Queuing Delay

- If a router is busy in processing and transmitting a packet, a freshly arrived packet has to wait in queue (buffer) for its turn.
- No queuing delay if the router is idle.
- Queuing delay varies with time and location. In general, it is a random variable.
- Order of microseconds to milliseconds.

Transmission Delay

- Time required to push the packet into the link
- If the length of the packet is L bits and transmission rate of the link is R bps, then

$$\text{Transmission delay} = \frac{L}{R}$$

- Order of microseconds to milliseconds

Propagation Delay

- Time required to **propagate** from one end of the link to the other end
- The propagation speed depends on the physical link between the routers
- In general, propagation speed s, is in the order of $2 \times 10^8 - 3 \times 10^8 \, m/s$.
- Propagation speed depends on the distance bewteen the routers, d
- Propagation delay $= \frac{d}{s}$

Traffic Intensity

- Queuing delays are random in nature
- Arrivals to a queue are also random in nature
- Traffic intensity is an indication of queuing delay
- Let a be the average number of packets arriving at a queue
- Each packet is of length L bits adn transmission rate is R bps
- Traffic intensity $= \frac{La}{R}$

Traffic Intensity

- If traffic intensity > 1, the *queuelength* increases to ∞
- It is desirable to have traffic intensity < 1.
- If traffic intensity close to 1, there will be a significant queuing delay
▶ Dependence of average queuing delay on traffic intensity
